Weekly Progress:

1. Opening Gmail through voice. Initially we tried to use chrome storage to store user voice input and display it in popup.html, later we figured out that can be done through message passing.
2. Researched about OCR, screen-reader. In the course of finding a proper text to speech implementation example to which we could refer to, we accidentally found out an implementation difference on TTS API of the chrome browser across Linux and windows.
3. We researched about App Script APIs and could understand its basic functionalities
